

CSCI 3022

intro to data science with probability & statistics

August 31, 2018

1. InterQuartile Range
2. Histograms
3. Boxplots

Bookkeeping

1st take
quizlet

Moodle: if you are not in a section, unenroll then reenroll using csci3022-Dan

Piazza: be on it, because no more emails!

<https://piazza.com/colorado/fall2018/csci3022>

Get Jupyter notebook / Anaconda Python: make sure you have a working install and check out the Numpy/Pandas tutorial (github/notebooks)

<https://www.anaconda.com/downloads>

Last time on CSCI 3022:

- Numerical summaries & summary statistics:

- Mean: $\frac{1}{n} \sum_{k=1}^n x_k = \bar{x}$

symbol \bar{x}

- Median: n odd, $\left(\frac{n+1}{2}\right)^{th}$ value

n even, $\left(\left(\frac{n+2}{2}\right)^{th} + \left(\frac{n}{2}\right)^{th}\right) / 2$

- Mode: most common value

- Sample Variance: $\frac{1}{n-1} \sum_{k=1}^n (x_k - \bar{x})^2$

- Standard Deviation: $\sqrt{\text{var}} = \sigma$

- Quartiles: $Q_2 = \text{Median}$
 $Q_1 = \text{median of lower half of data}$
 $Q_3 = \text{median of upper half of data}$

InterQuartile Range (IQR)

Definition: IQR the difference between Q_3 and Q_1 . It's the 'range' of 50% of the data.

Example: Compute the IQR of {6, 7, 15, 36, 39, 40, 41, 42, 43, 47, 49}

$$\begin{array}{cccccccccccccccc} & 1 & 2 & 3 & 4 & 5 & 6 & 7 & 8 & 9 & 10 & 11 \\ & 1 & 2 & 3 & 4 & 5 & 6 & 1 & 2 & 3 & 4 & 5 & 6 \\ \text{IQR} = Q_3 - Q_1 = & & & & & & & & & & & & \\ 42.5 - 25.5 = 17 & Q_1 = 25.5 = \frac{51}{2} = \frac{15+36}{2} & Q_2 = 40 & Q_3 = 42.5 = \frac{42+43}{2} \end{array}$$

Tukey's 5 number summary.

John Tukey advocated that we summarize datasets with 5 values.

1. Minimum
2. Q1
3. Q2 (Median)
4. Q3
5. Max

John Wilder Tukey

Why we like this:

Gives the center of the data

Gives the spread through the easily computable IQR and range

Gives an idea of skewness

invented FFT, coined the term “bit” = “binary digit”
up there with Grace Hopper and the other demigods

James William Cooley

What about Graphical Summaries of data?

Two key types that we'll dig into today:

What about Graphical Summaries of data?

Two key types that we'll dig into today:

Histogram: FYI, not the same as #throwbackthursday.

A histogram is a great way to visually understand a *single distribution*.

What about Graphical Summaries of data?

Two key types that we'll dig into today:

Histogram: FYI, not the same as #throwbackthursday.
A histogram is a great way to visually understand a *single distribution*.

Boxplot: sometimes called *box-and-whisker-plot*.
A boxplot is a great way to visually compare *multiple distributions*.

Histograms. Why?

Yellowstone National Park
O.F. erupts every 44 to 125 mins
for a ~2 to 5 mins.

28	304	306								

df.sort_values(...)

Histograms. Why?

A histogram shows us how the data are *distributed*.

Easy to **compute**.

Easy to **understand**.

28	304	306								

`df.sort_values(...)`

Imagine all these data points on an axis...

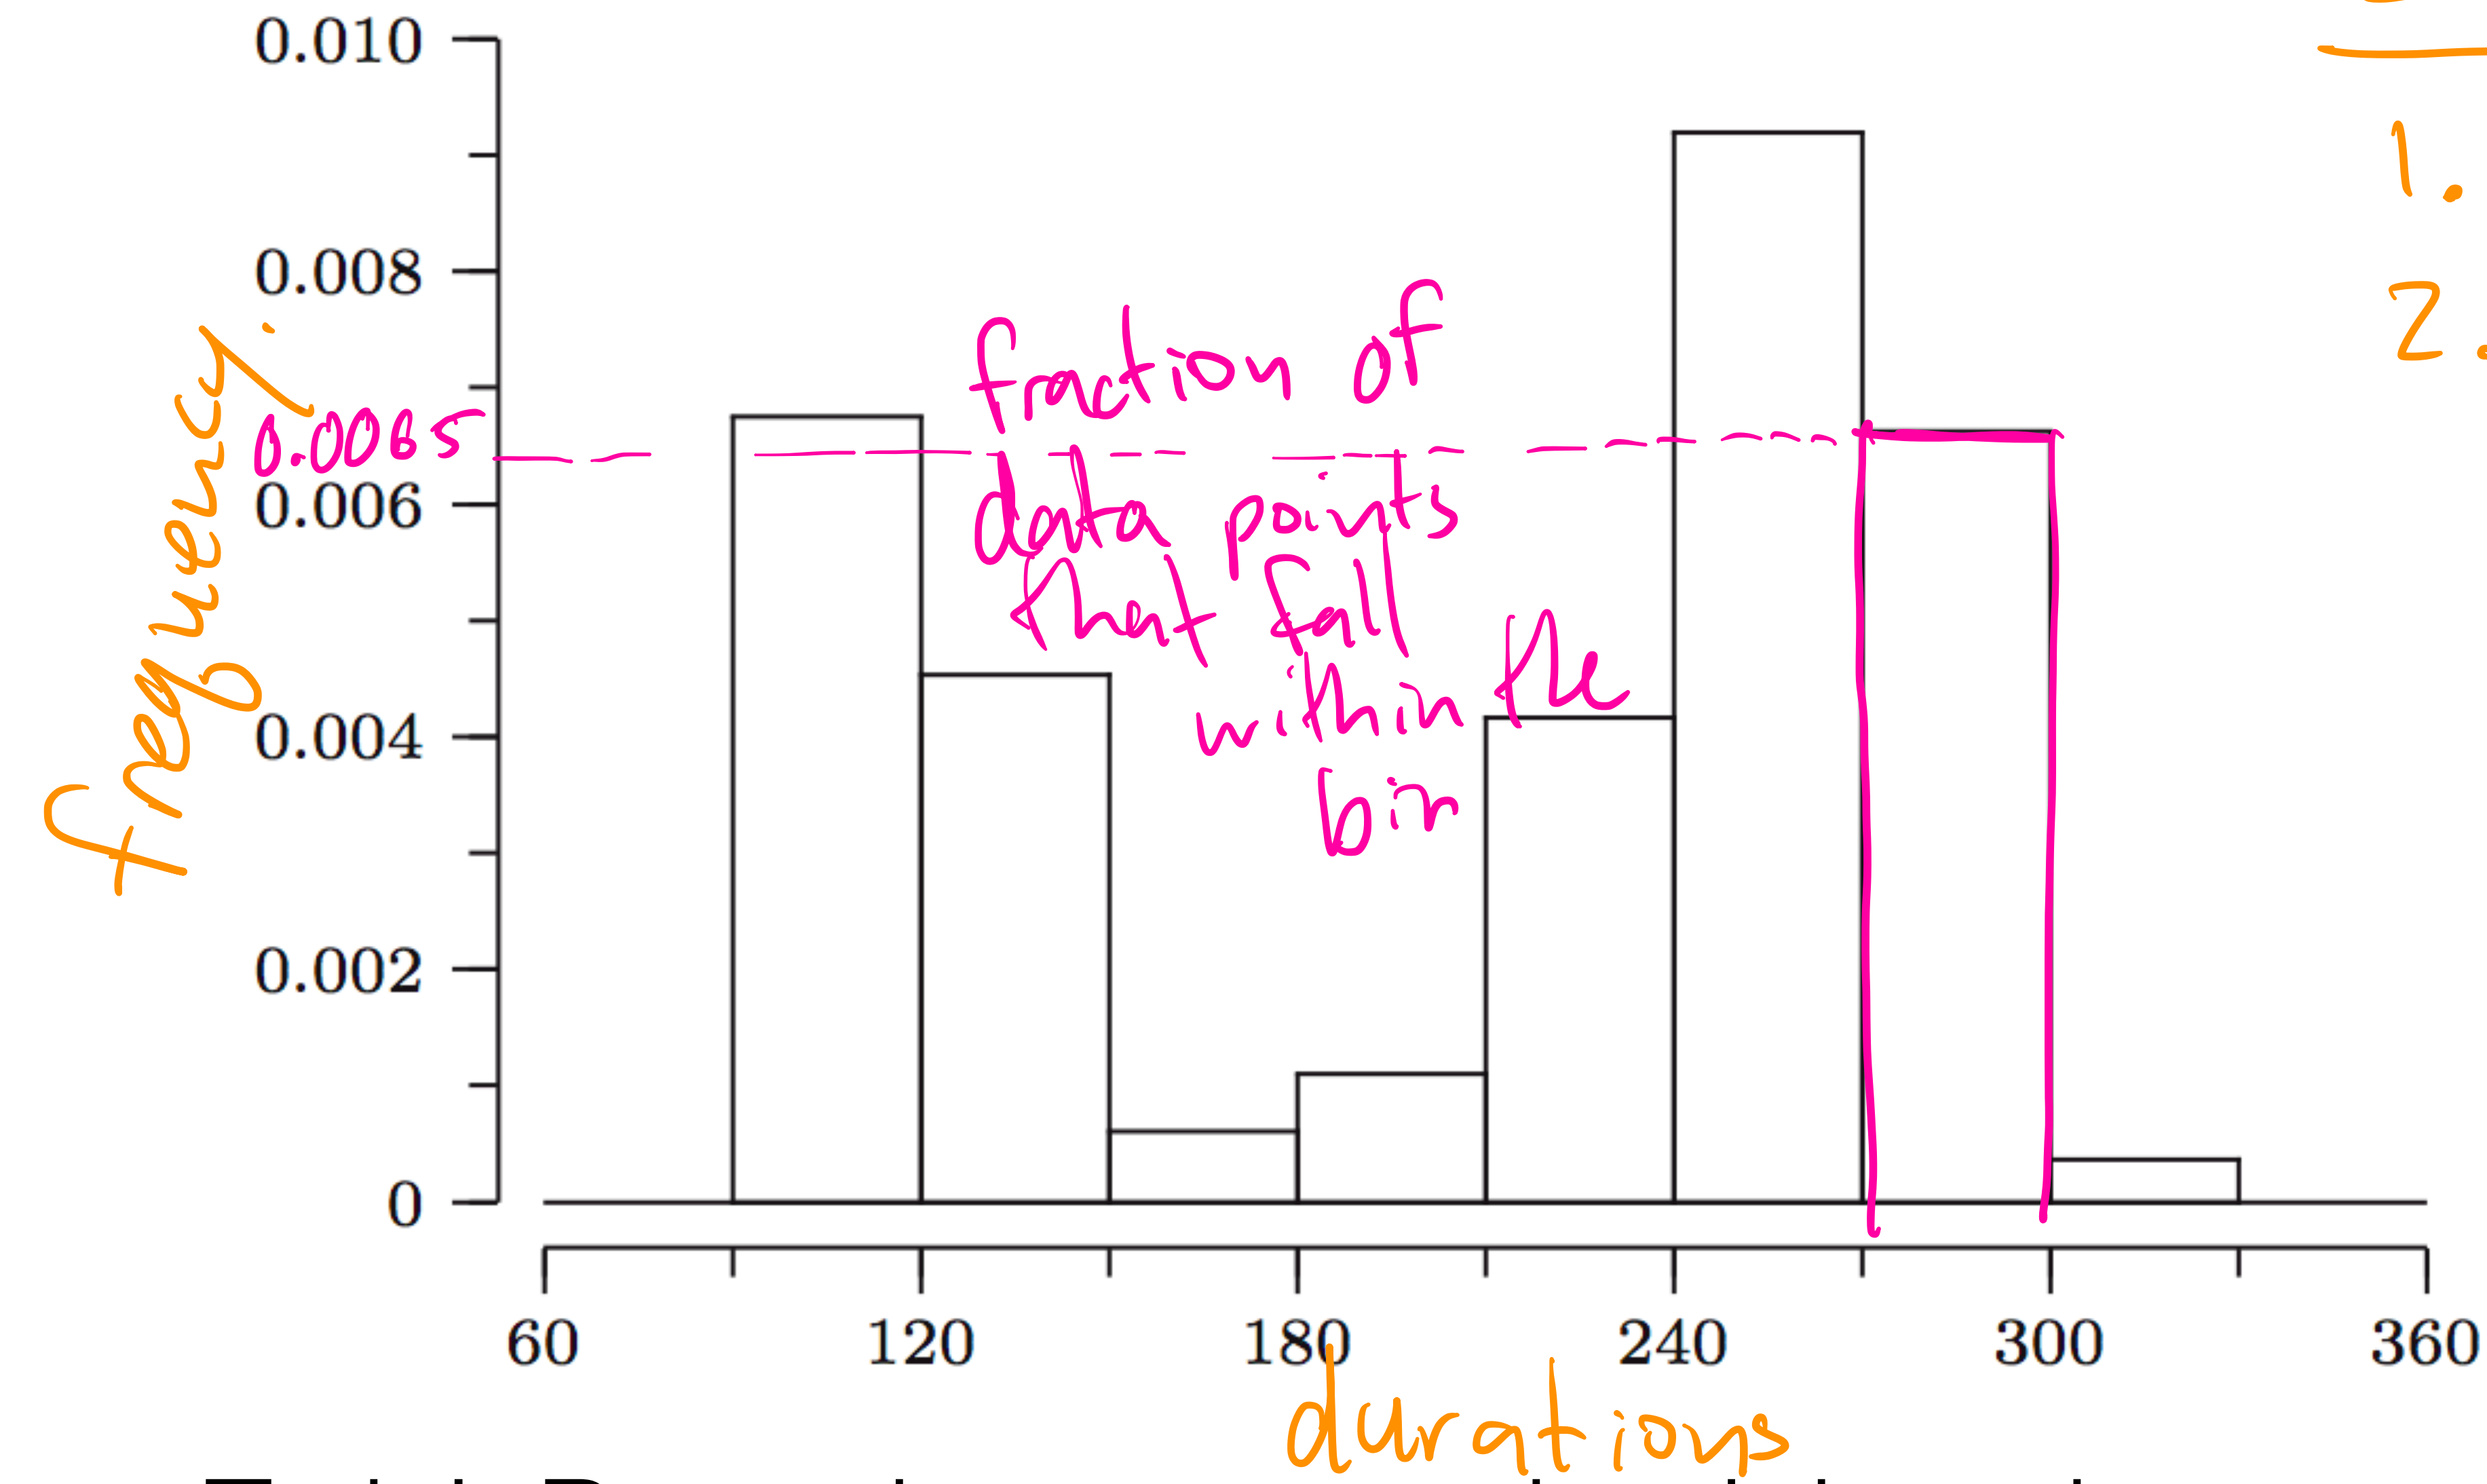

1	96	100	102	104	105	105	105	105	105	105
2	107	107	108	108	108	108	109	109	109	110
3	110	110	110	110	110	110	111	111	112	112
4	112	112	112	112	112	112	113	113	113	113
5	115	115	116	116	117	118	118	118	119	119
6	119	120	120	120	120	121	121	121	122	122
7	124	125	125	126	126	126	128	129	130	130
8	131	132	132	132	133	134	134	135	135	136
9	137	138	139	140	141	142	143	144	144	145
10	145	149	157	158	168	173	174	184	199	200
11	200	202	205	207	210	210	214	214	216	216
12	216	216	221	223	224	225	226	226	229	230
13	230	230	230	230	231	231	233	235	235	235
14	237	237	238	238	240	240	240	240	240	240
15	242	242	243	244	244	245	245	245	245	245
16	246	246	247	247	248	248	249	249	249	249
17	250	250	250	250	251	252	254	254	254	255
18	255	255	255	256	256	257	257	258	258	259
19	260	260	260	260	260	261	261	261	261	262
20	262	262	262	263	264	265	265	265	265	266
21	266	267	267	267	268	268	269	270	270	270
22	270	270	270	270	270	271	272	272	272	272
23	272	273	274	274	274	275	275	275	275	276
24	276	276	276	277	278	278	278	279	280	280
25	282	282	282	282	282	282	283	284	285	286
26	287	288	288	288	288	288	288	289	289	290
27	290	291	293	294	294	296	296	296	300	302
28	304	306								

Then, divide the line into “bins” and count.

```
df.sort_values(...)
```

Old Faithful Histogram

2 kinds
1. count
2. frequency.

Tada! But wait... your textbook has done something peculiar.
Can you spot it?

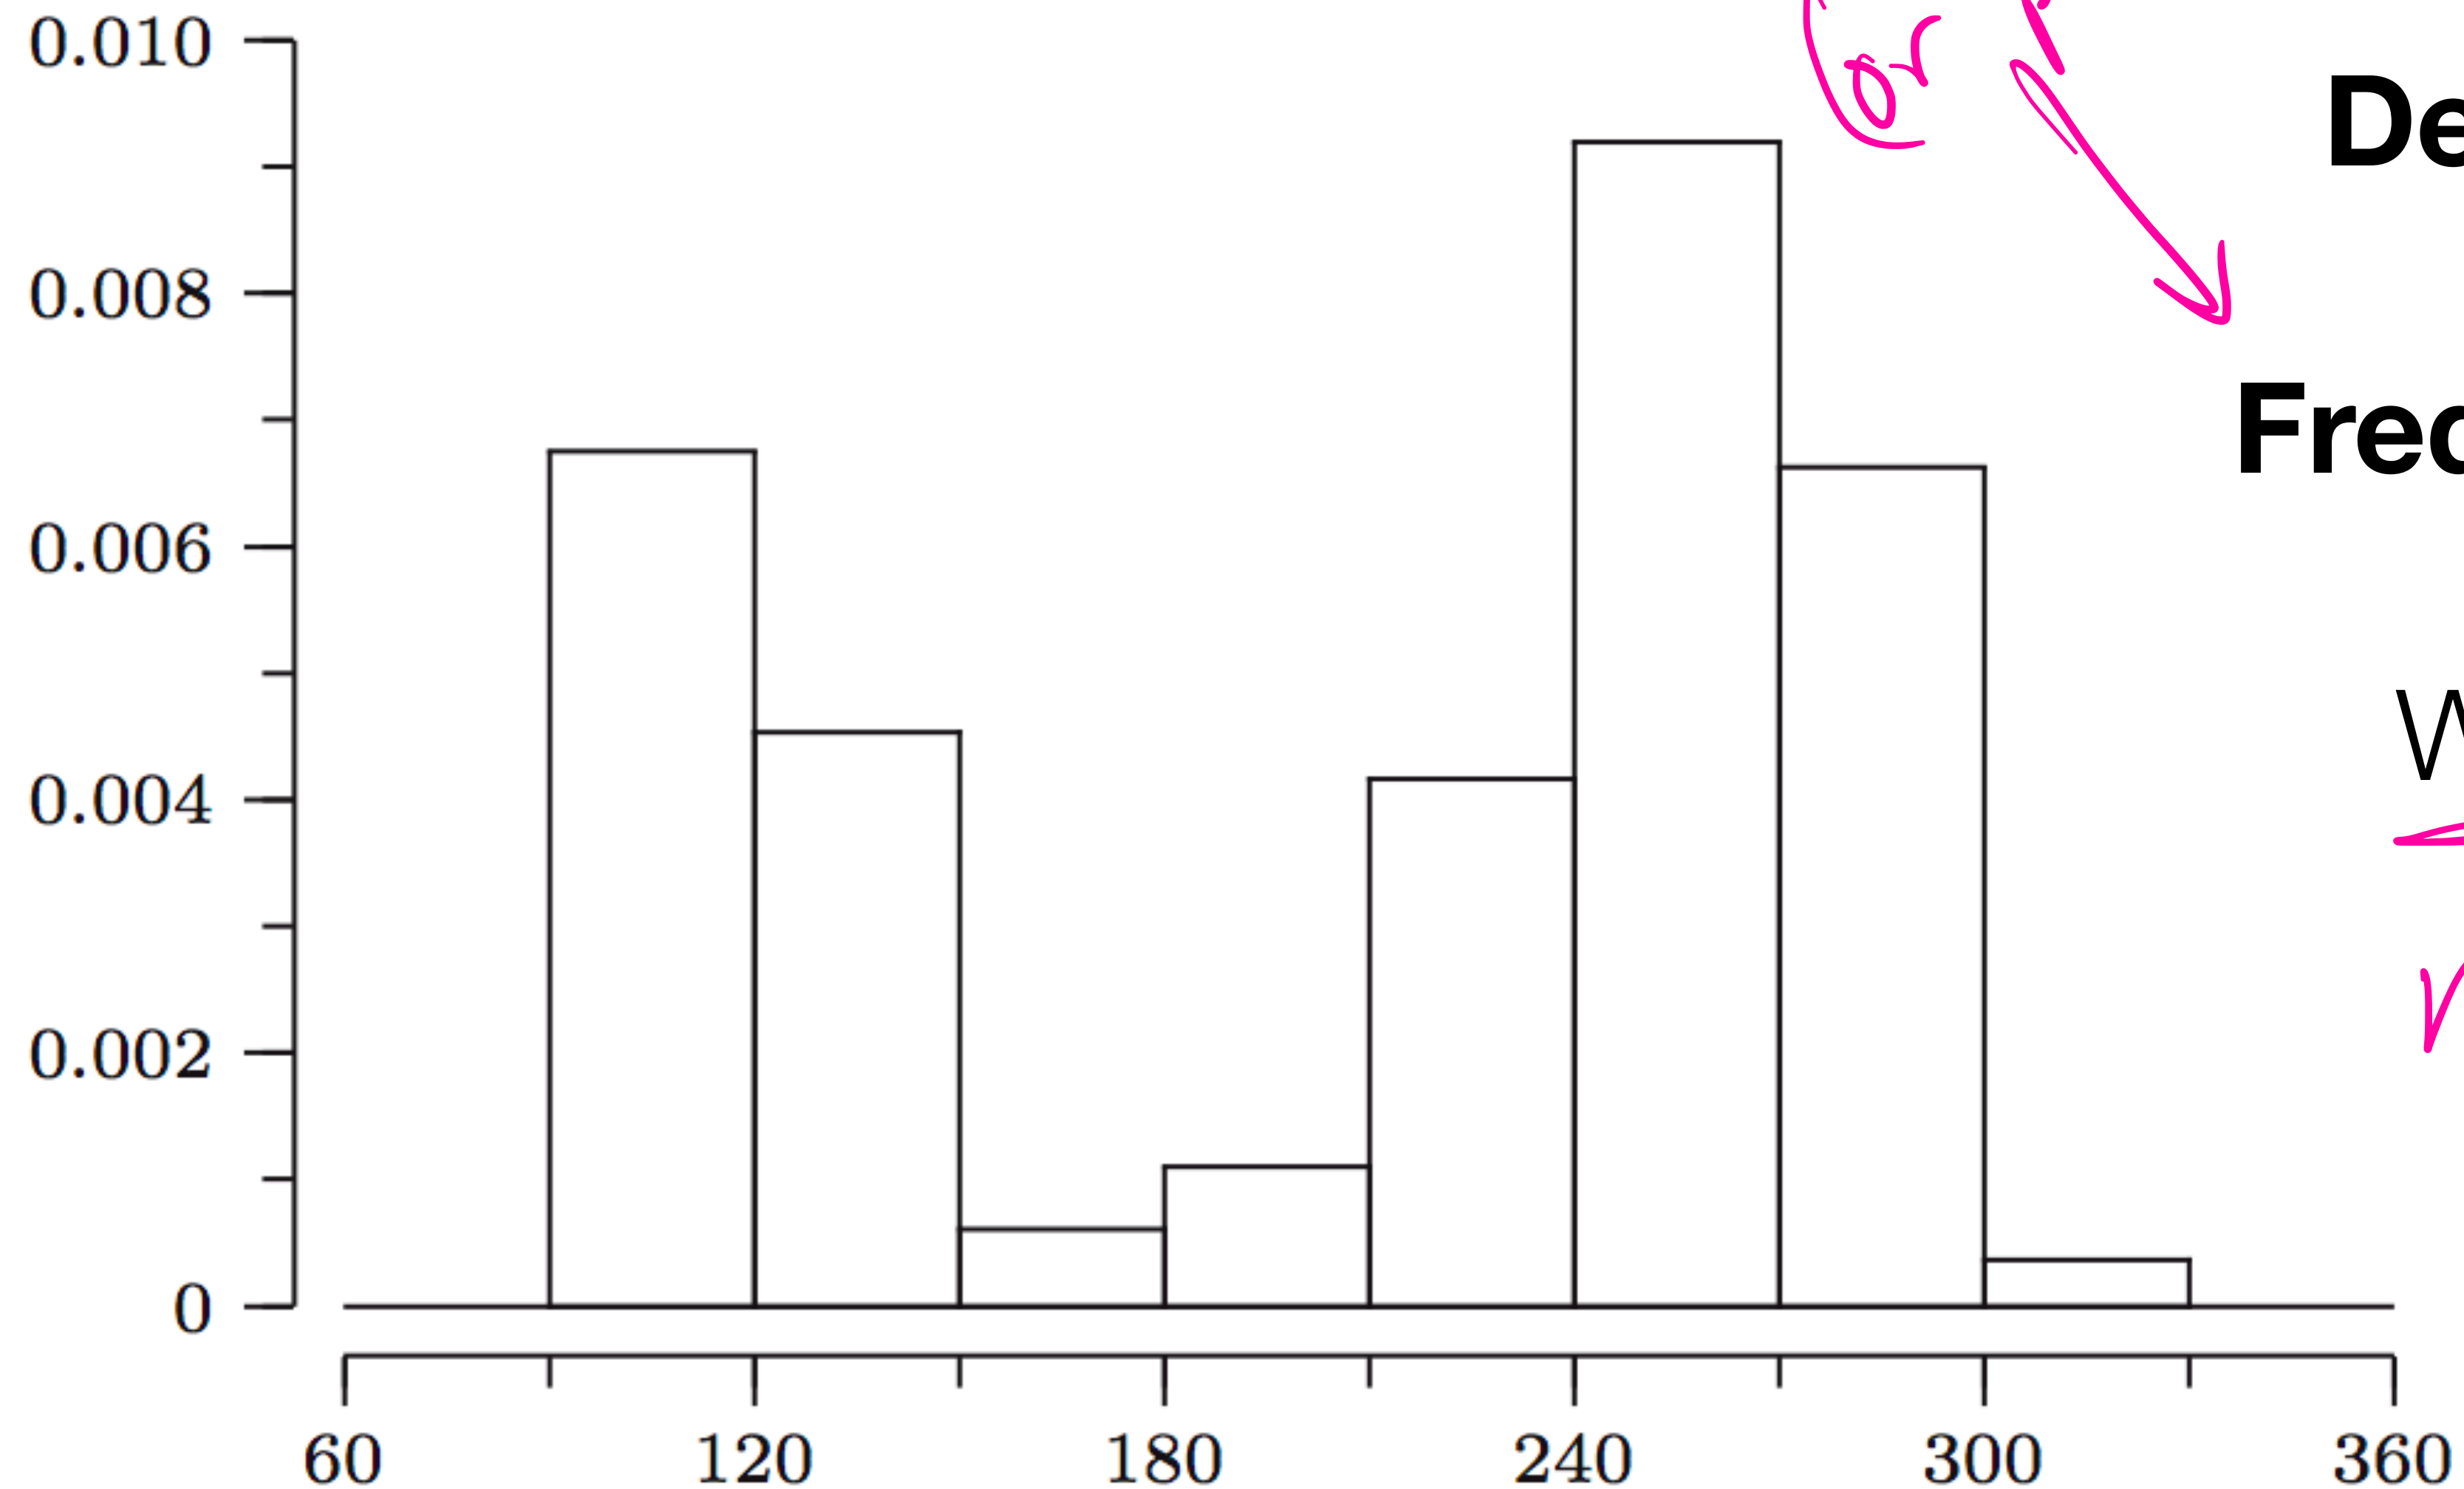

Old Faithful Histogram

Density histogram
vs
Count histogram
When/which?

Tada! But wait... your textbook has done something peculiar.
Can you spot it?

Old Faithful Histogram

(or percentage)

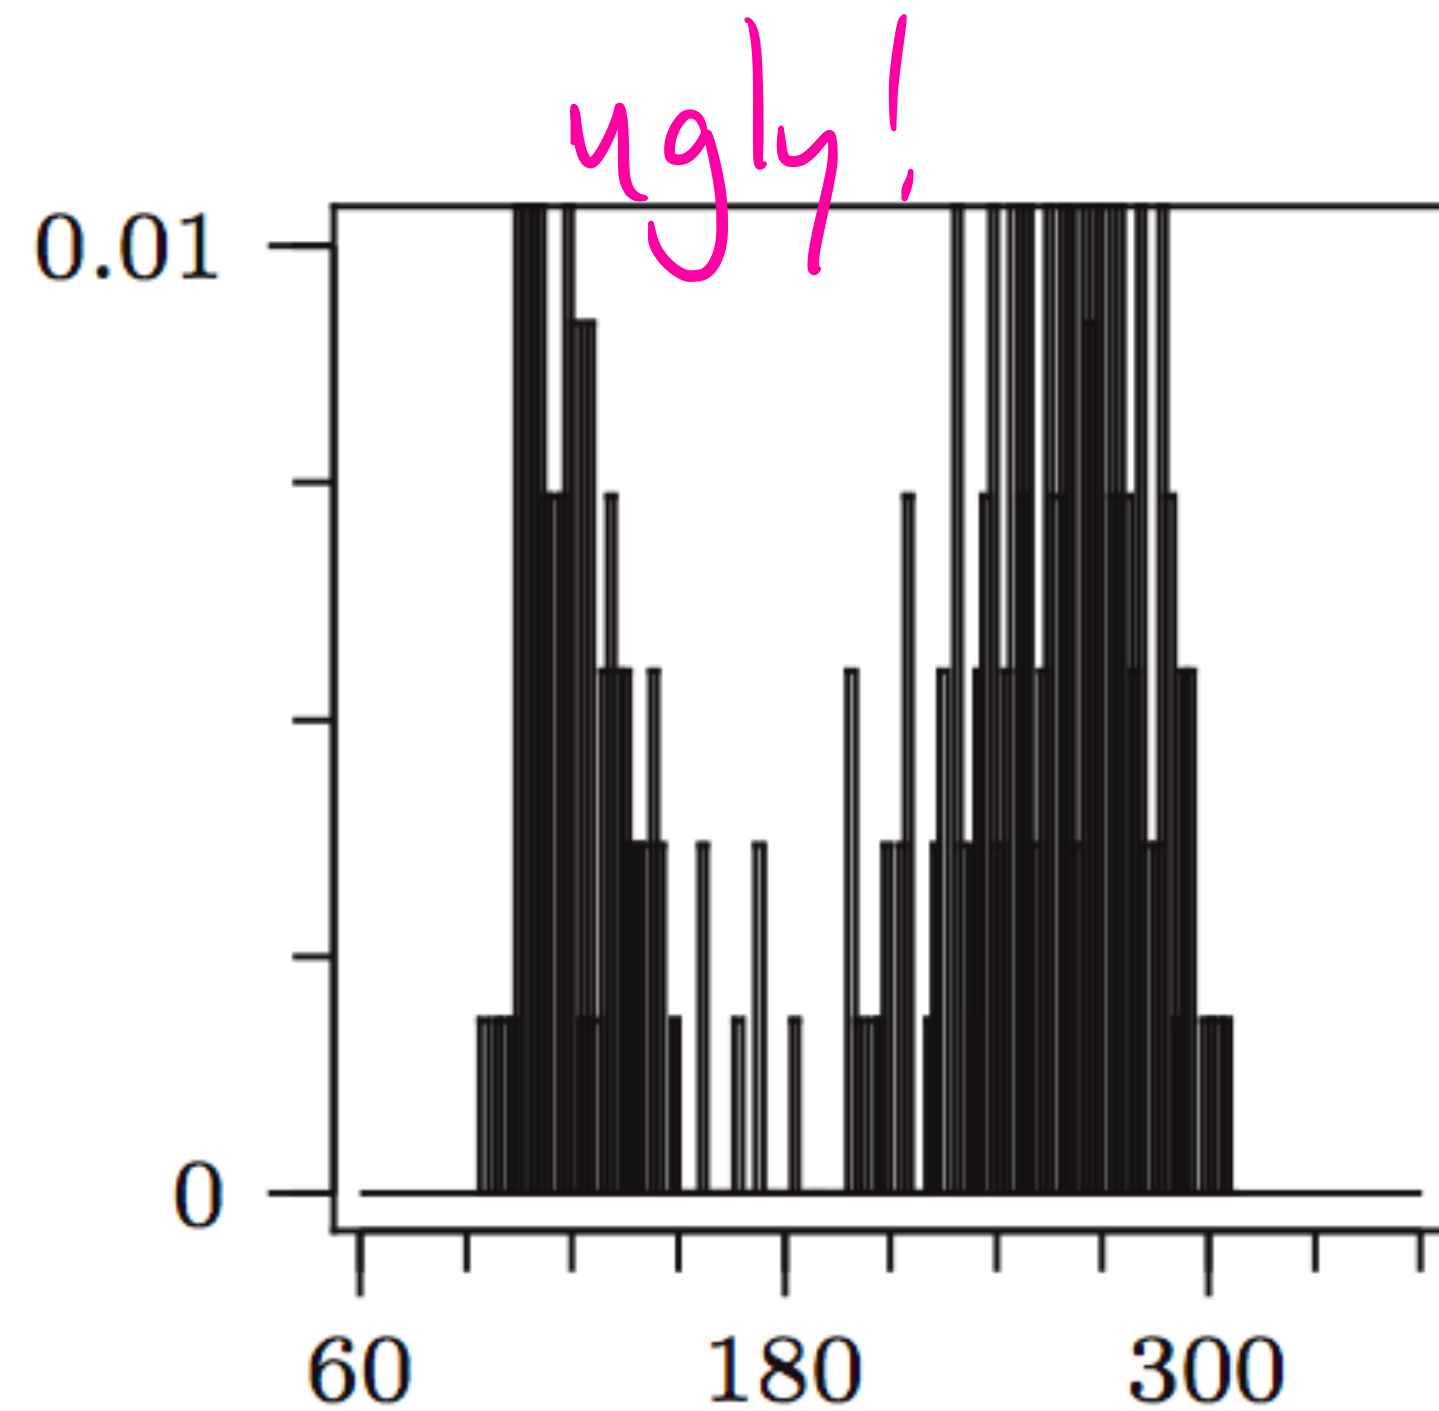

Density histogram
vs
Frequency histogram

Which is better?

not a good question!

Tada! But wait... your textbook has done something peculiar.
Can you spot it?

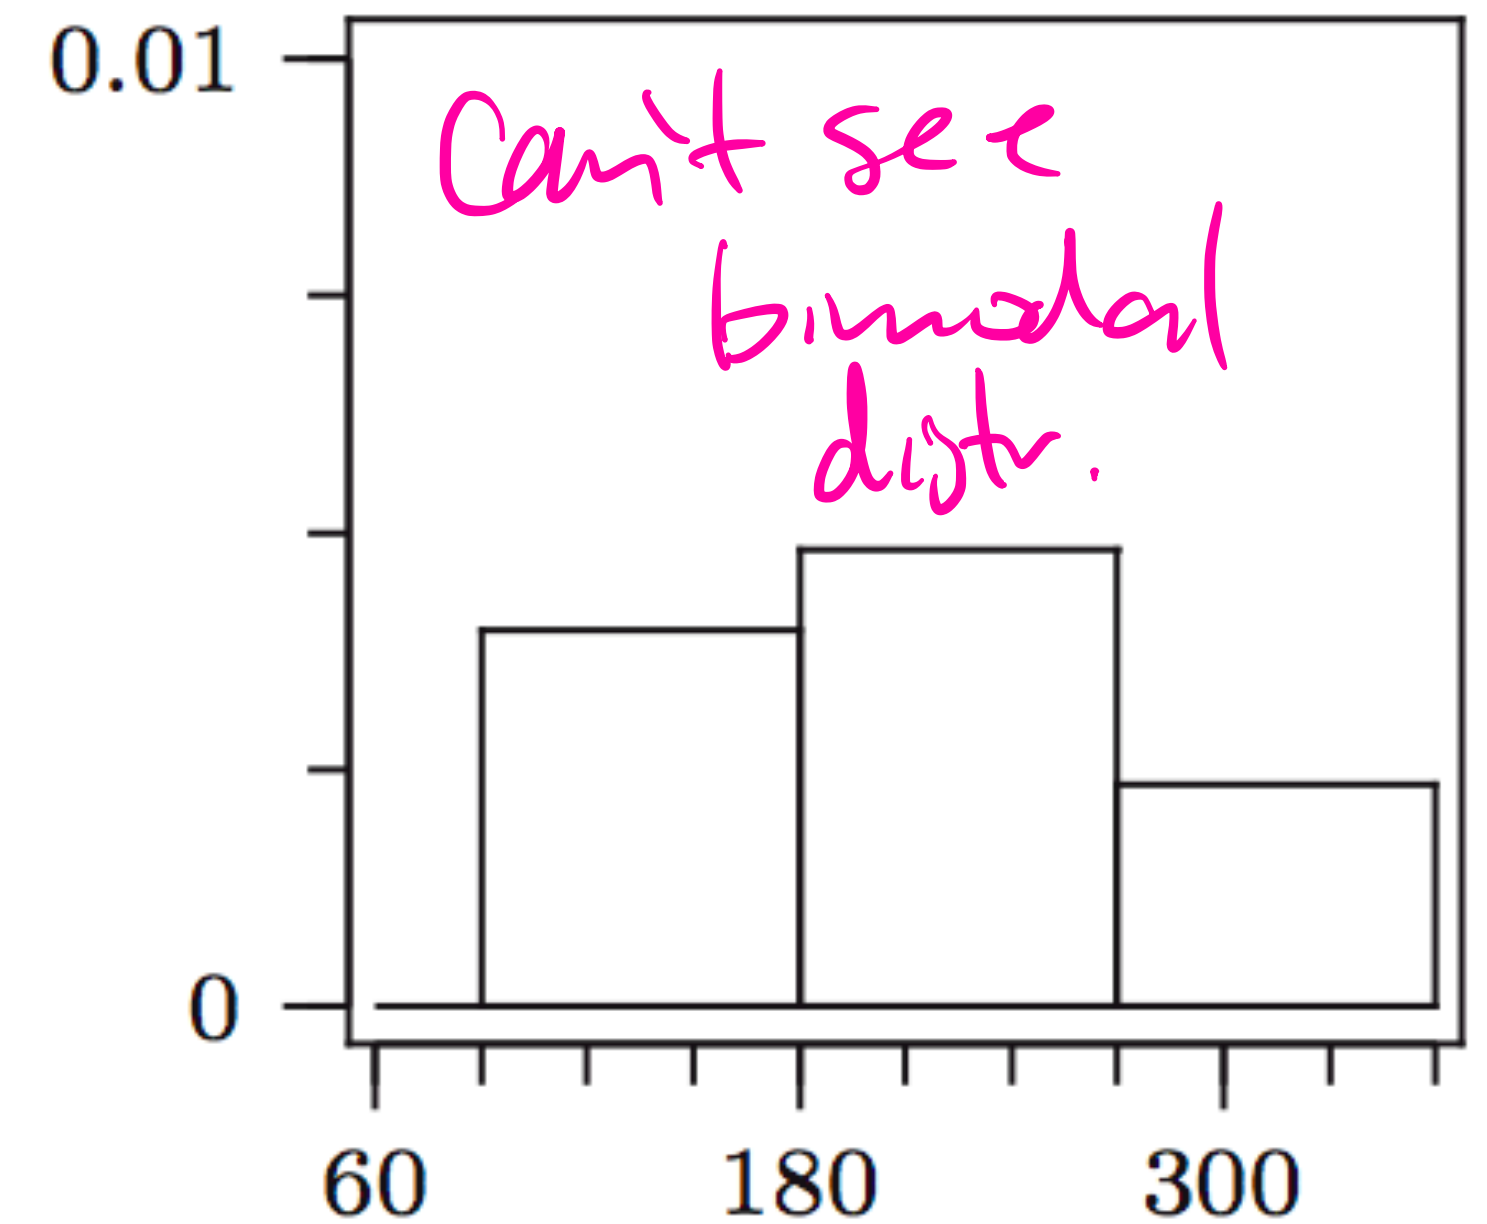

Bins, Bins, Bins...

Bin width 2

Bin width 30

Bin width 90

These are all histograms. They're all correct.
However, the one in the middle is more useful. Why?

Bins, Bins, Bins...

Bin width 2

Bin width 30

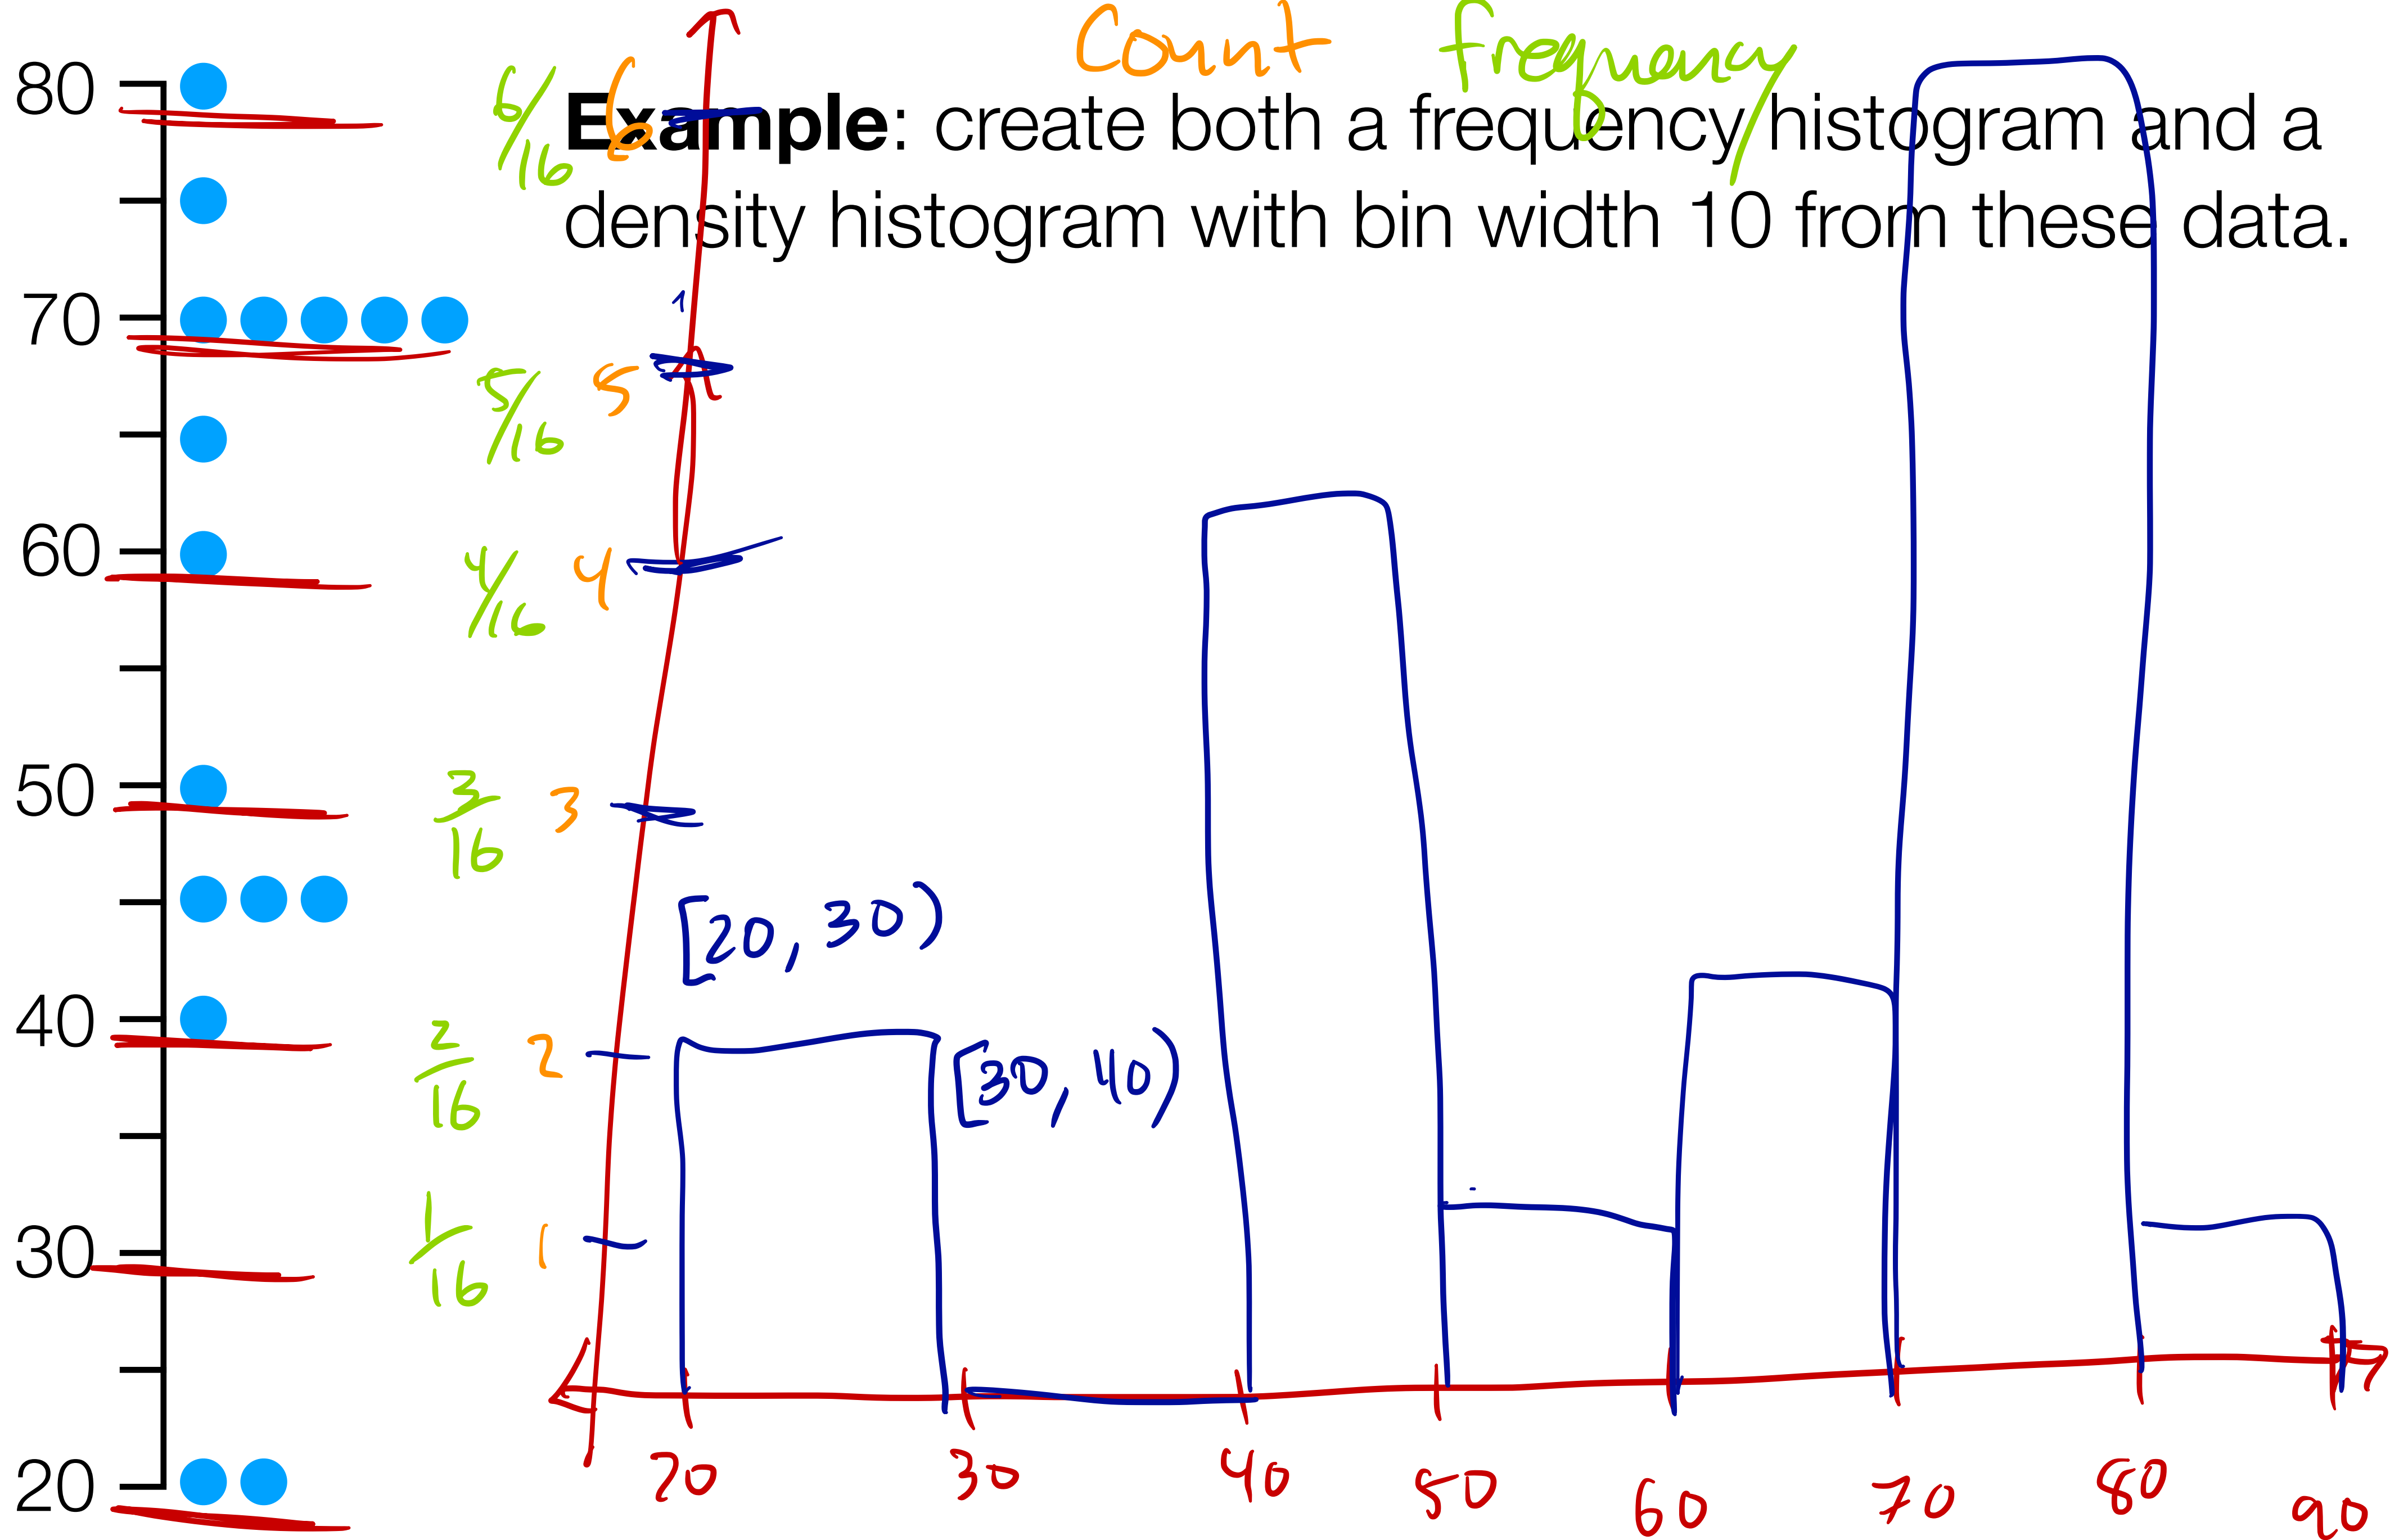

Bin width 90

These are all histograms. They're all correct.
However, the one in the middle is more useful. Why?

Goldilocks bin sizes, Freedman & Diaconis $= 2 \frac{IQR}{n^{1/3}} = 2 \frac{Q_3 - Q_1}{n^{1/3}}$

Count frequency

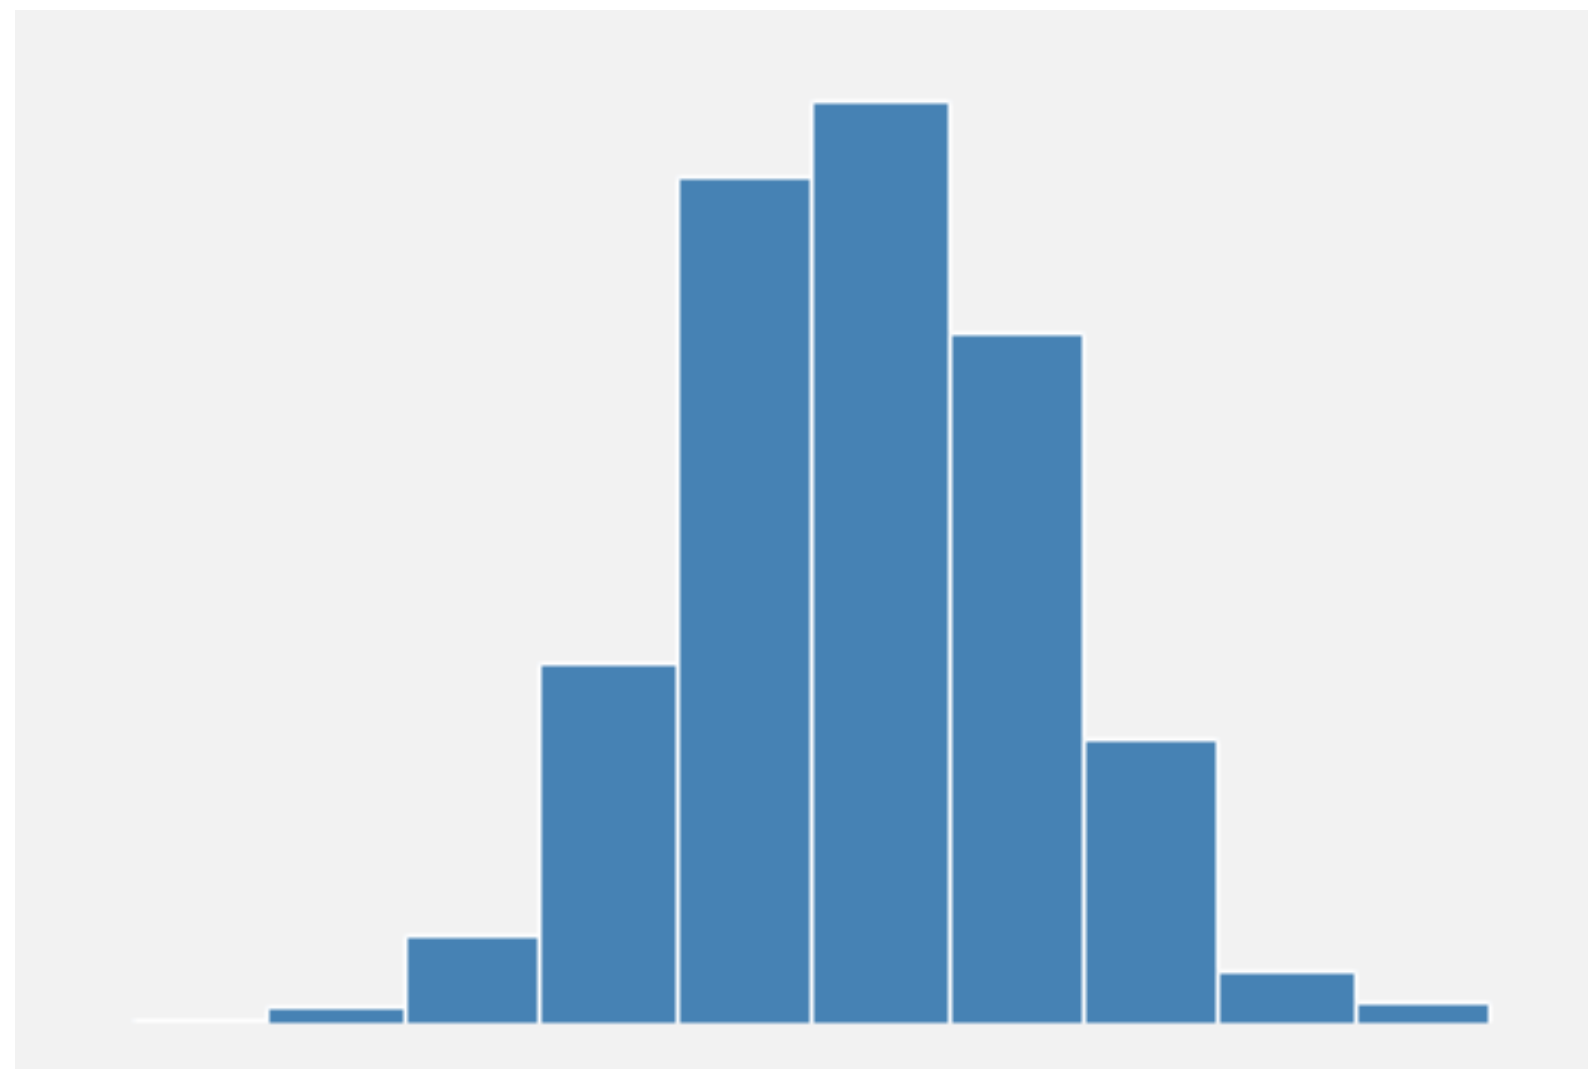

Example: create both a frequency histogram and a density histogram with bin width 10 from these data.

Modes...

We talked before about “the” mode, i.e. the most frequent value.

Often, it’s useful to describe whether a distribution has multiple *separated* high frequency values. Histograms make this easy:

unimodal

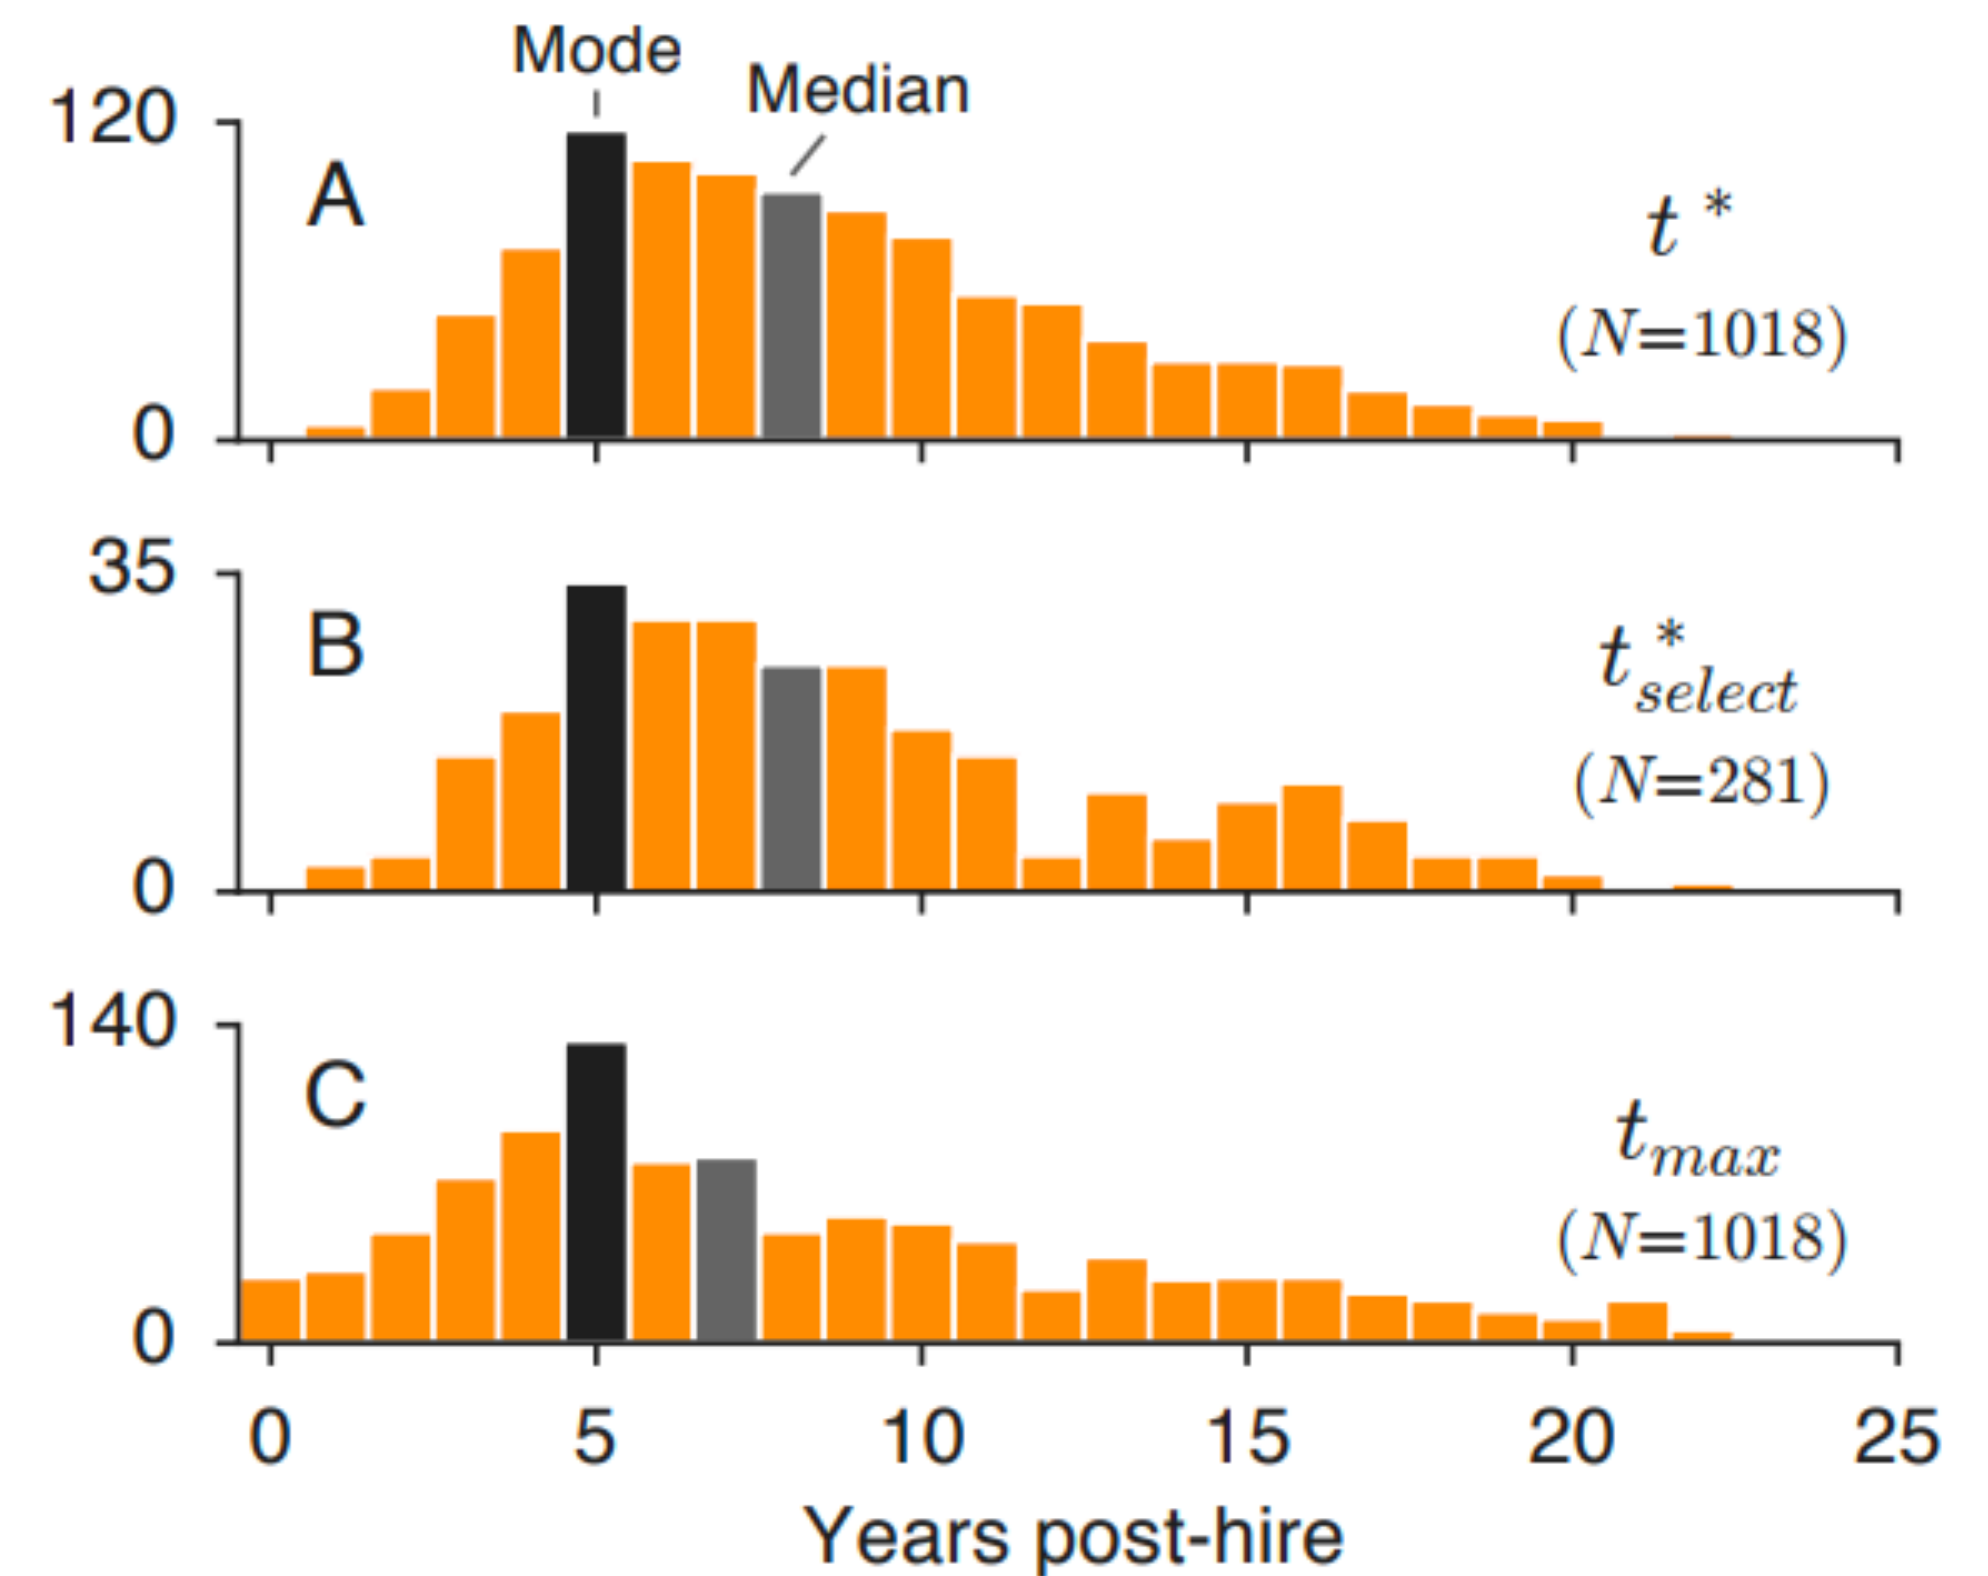

bimodal

multimodal

Review: what about skew?

Histograms in the wild!

"Gender, Productivity, and Prestige in Computer Science Faculty Hiring Networks"
Samuel F. Way, Daniel B. Larremore, and Aaron Clauset. Proc. 2016 World Wide Web Conference (WWW), 1169-1179 (2016).

"The misleading narrative of the canonical faculty productivity trajectory"
Samuel F. Way, Allison C. Morgan, Aaron Clauset, and Daniel B. Larremore. (2016)

BoxPlots! But first... quartile review.

Example: what are the quartiles of this distribution?

BoxPlots!

- The **Box** extends from Q_1 to Q_3 .
- The **Median Line** goes through median
- The **Whiskers** extend to farthest point within $1.5 \times IQR$
- The Fliers or outliers are any points outside of whiskers
- The **width** of the box is unimportant.

BoxPlots!

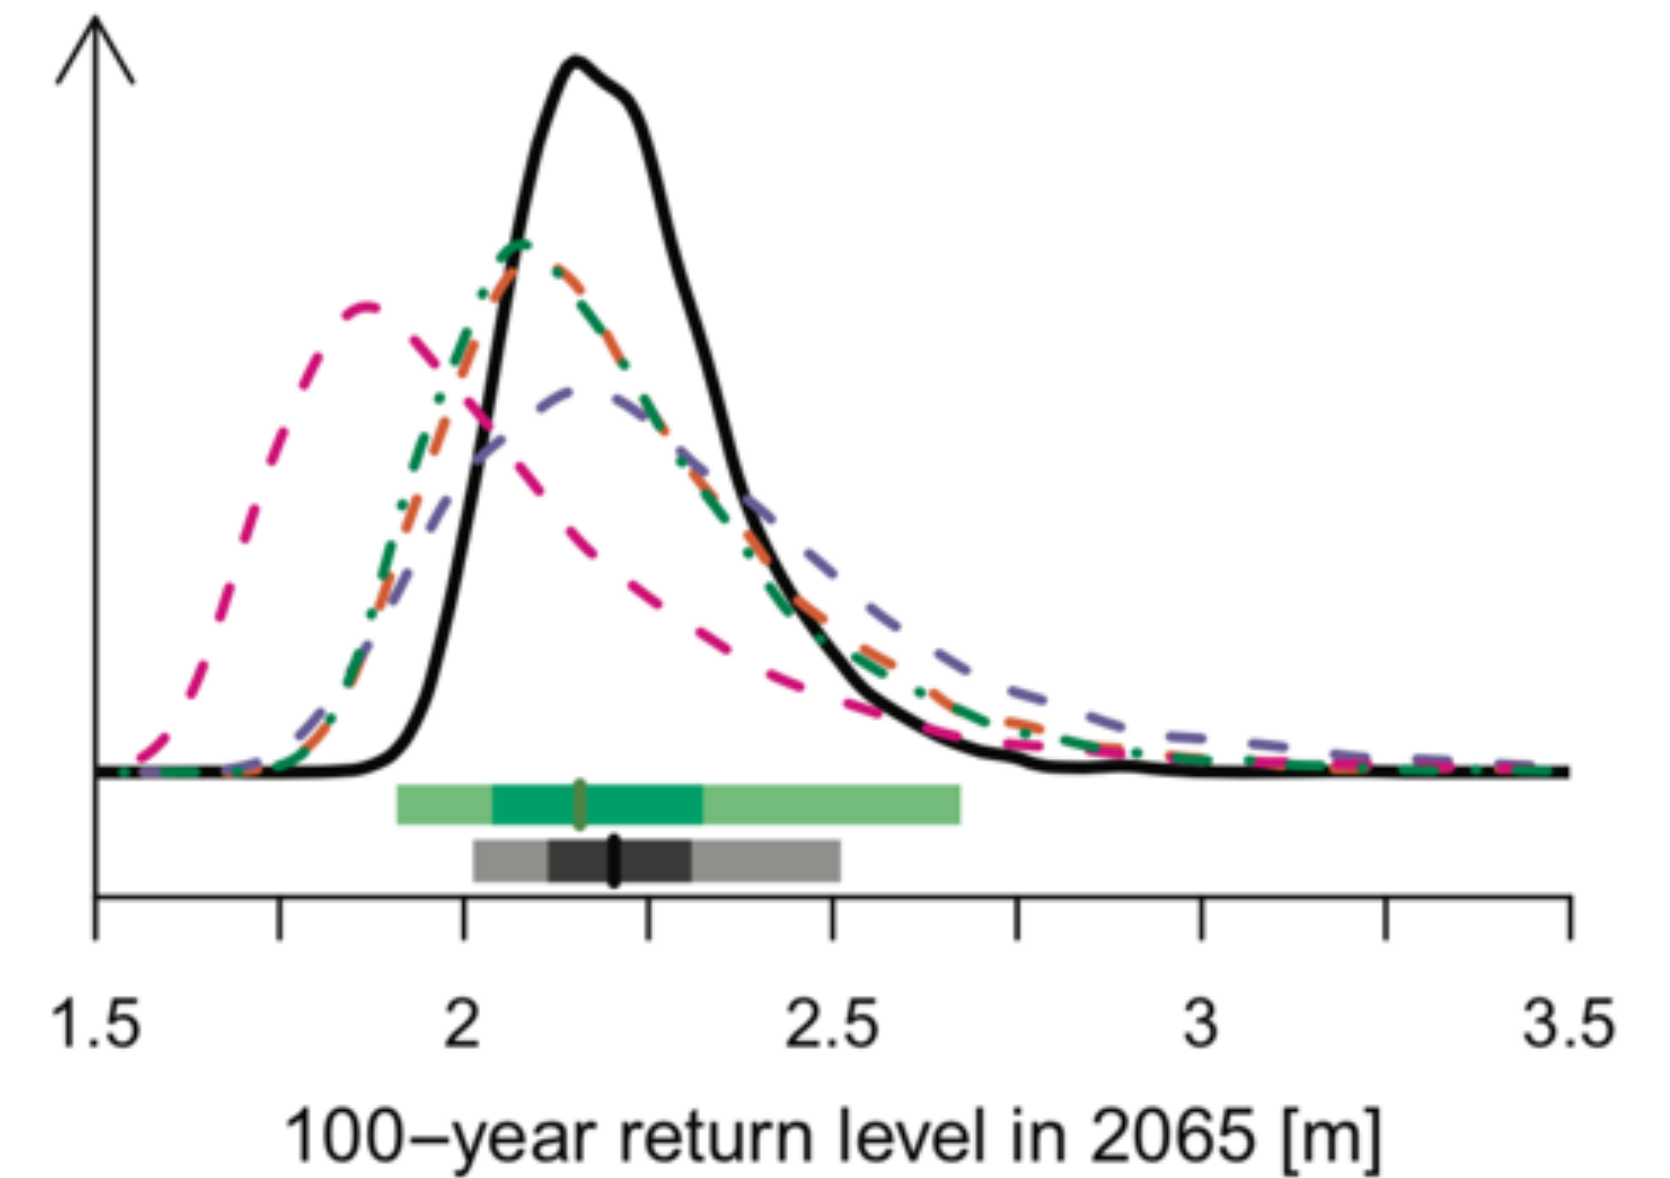

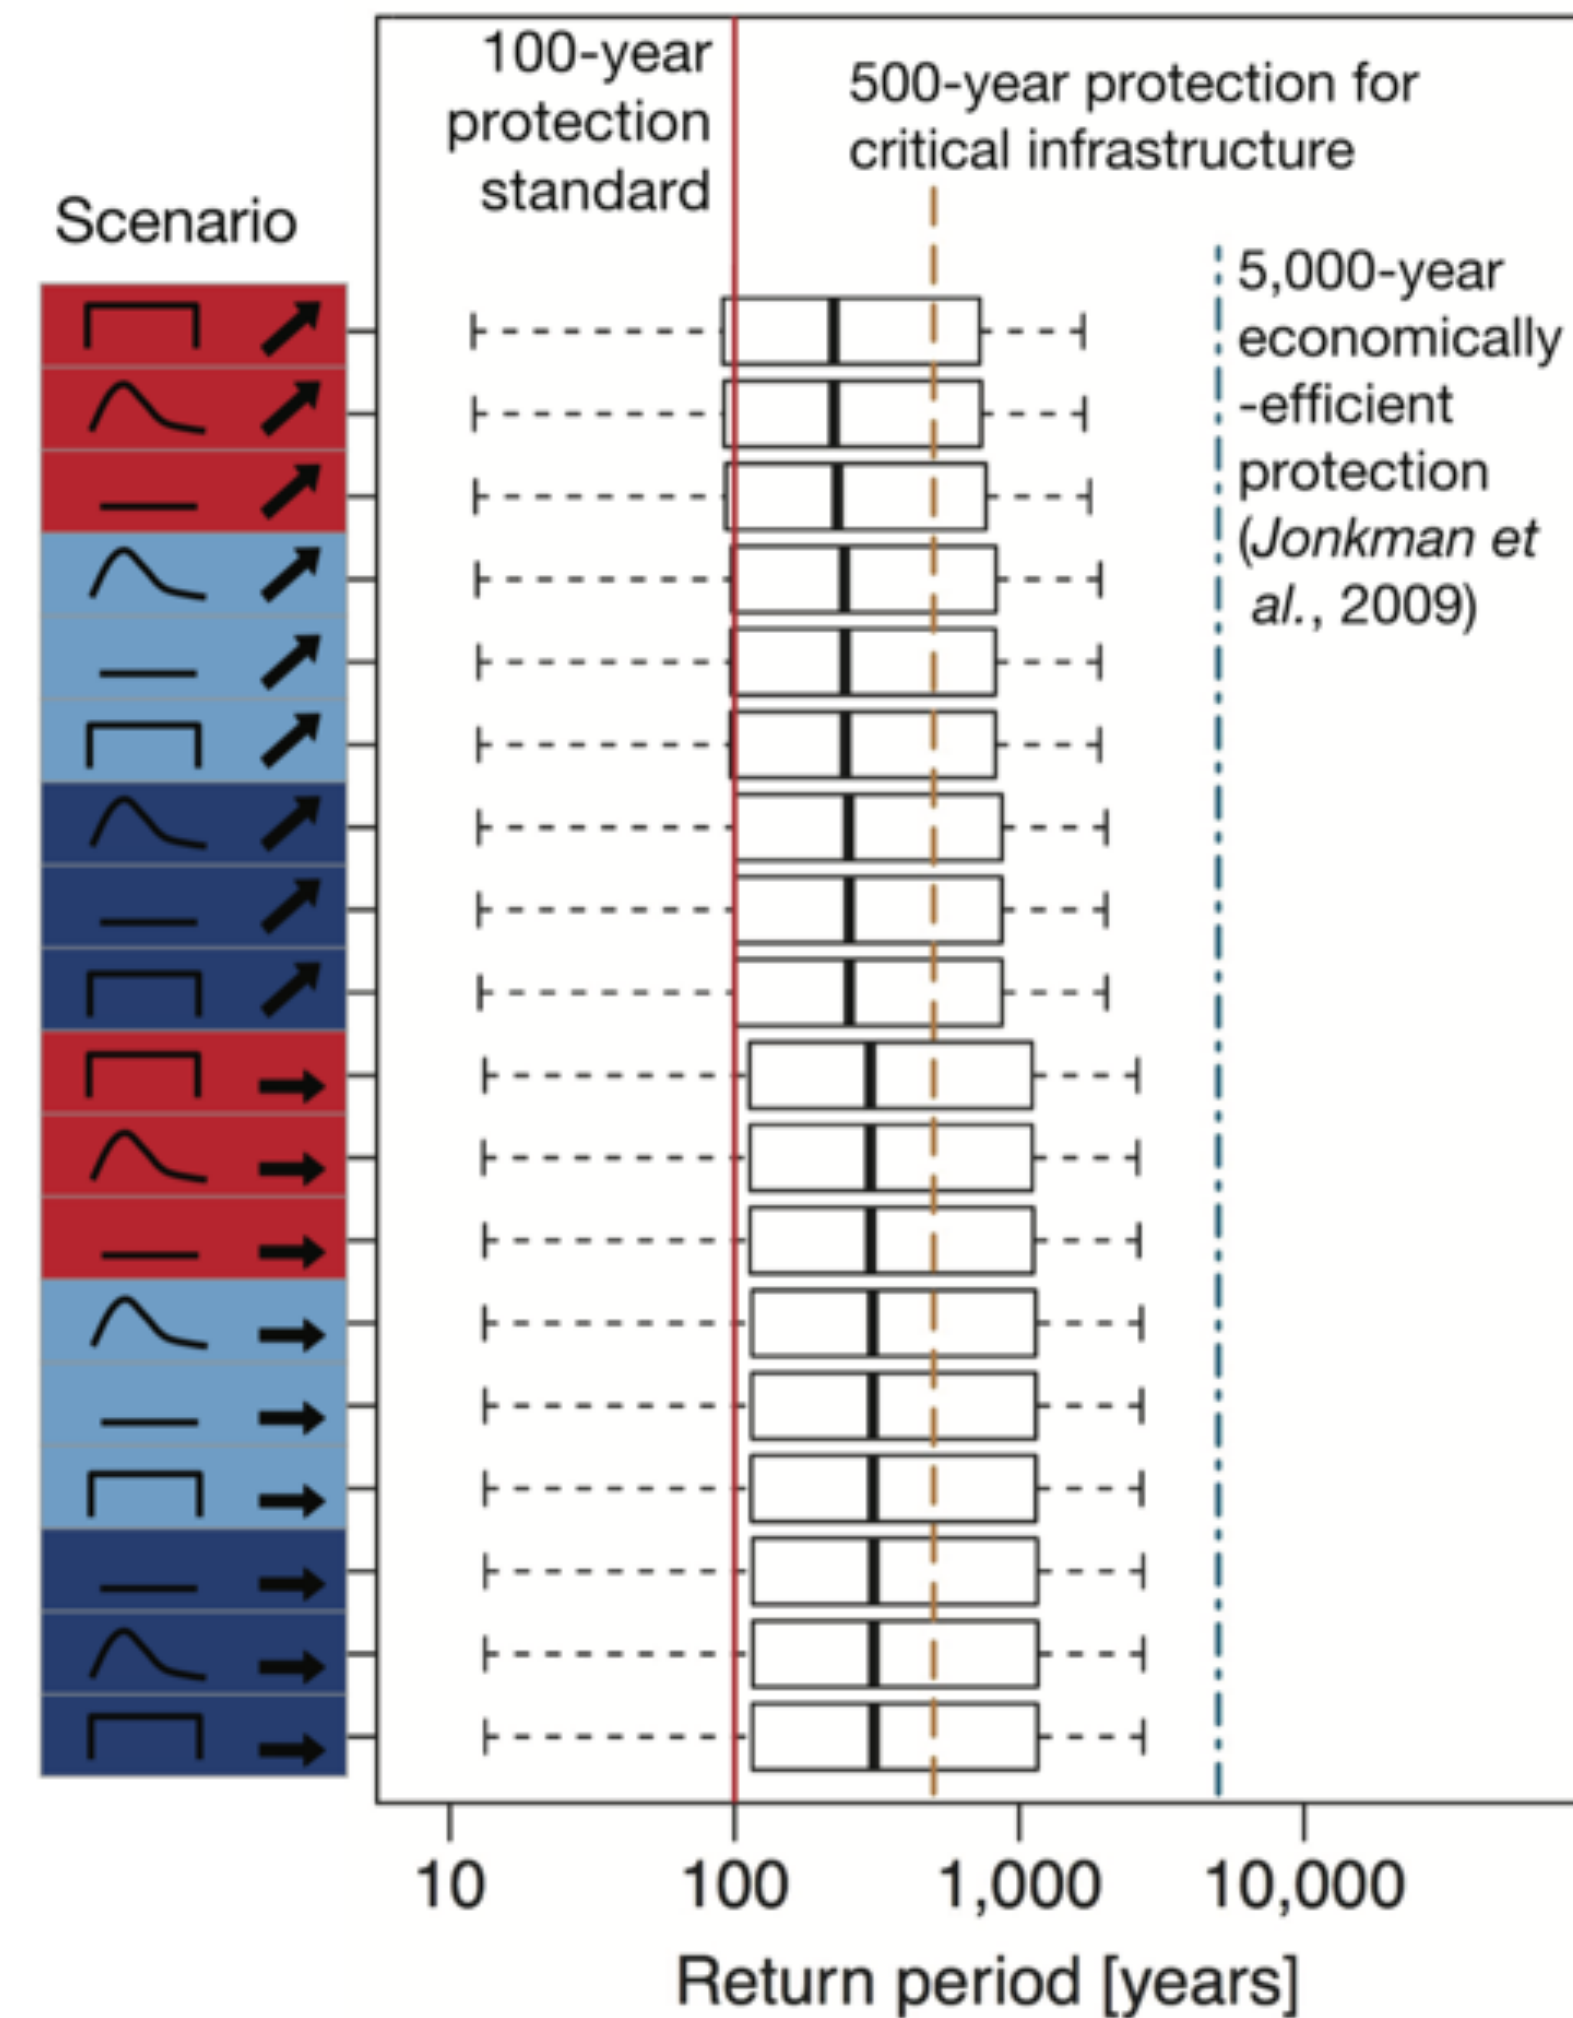

- The **Box** extends from Q_1 to Q_3 .
- The **Median Line** goes through median
- The **Whiskers** extend to farthest point within $1.5 \times \text{IQR}$
- The Fliers or **outliers** are any points outside of whiskers
- The **width** of the box is unimportant.

Boxplots are a visualization of Tukey's 5# summary.

BoxPlots!

Boxplots are great for comparing multiple datasets or pieces of a dataset.

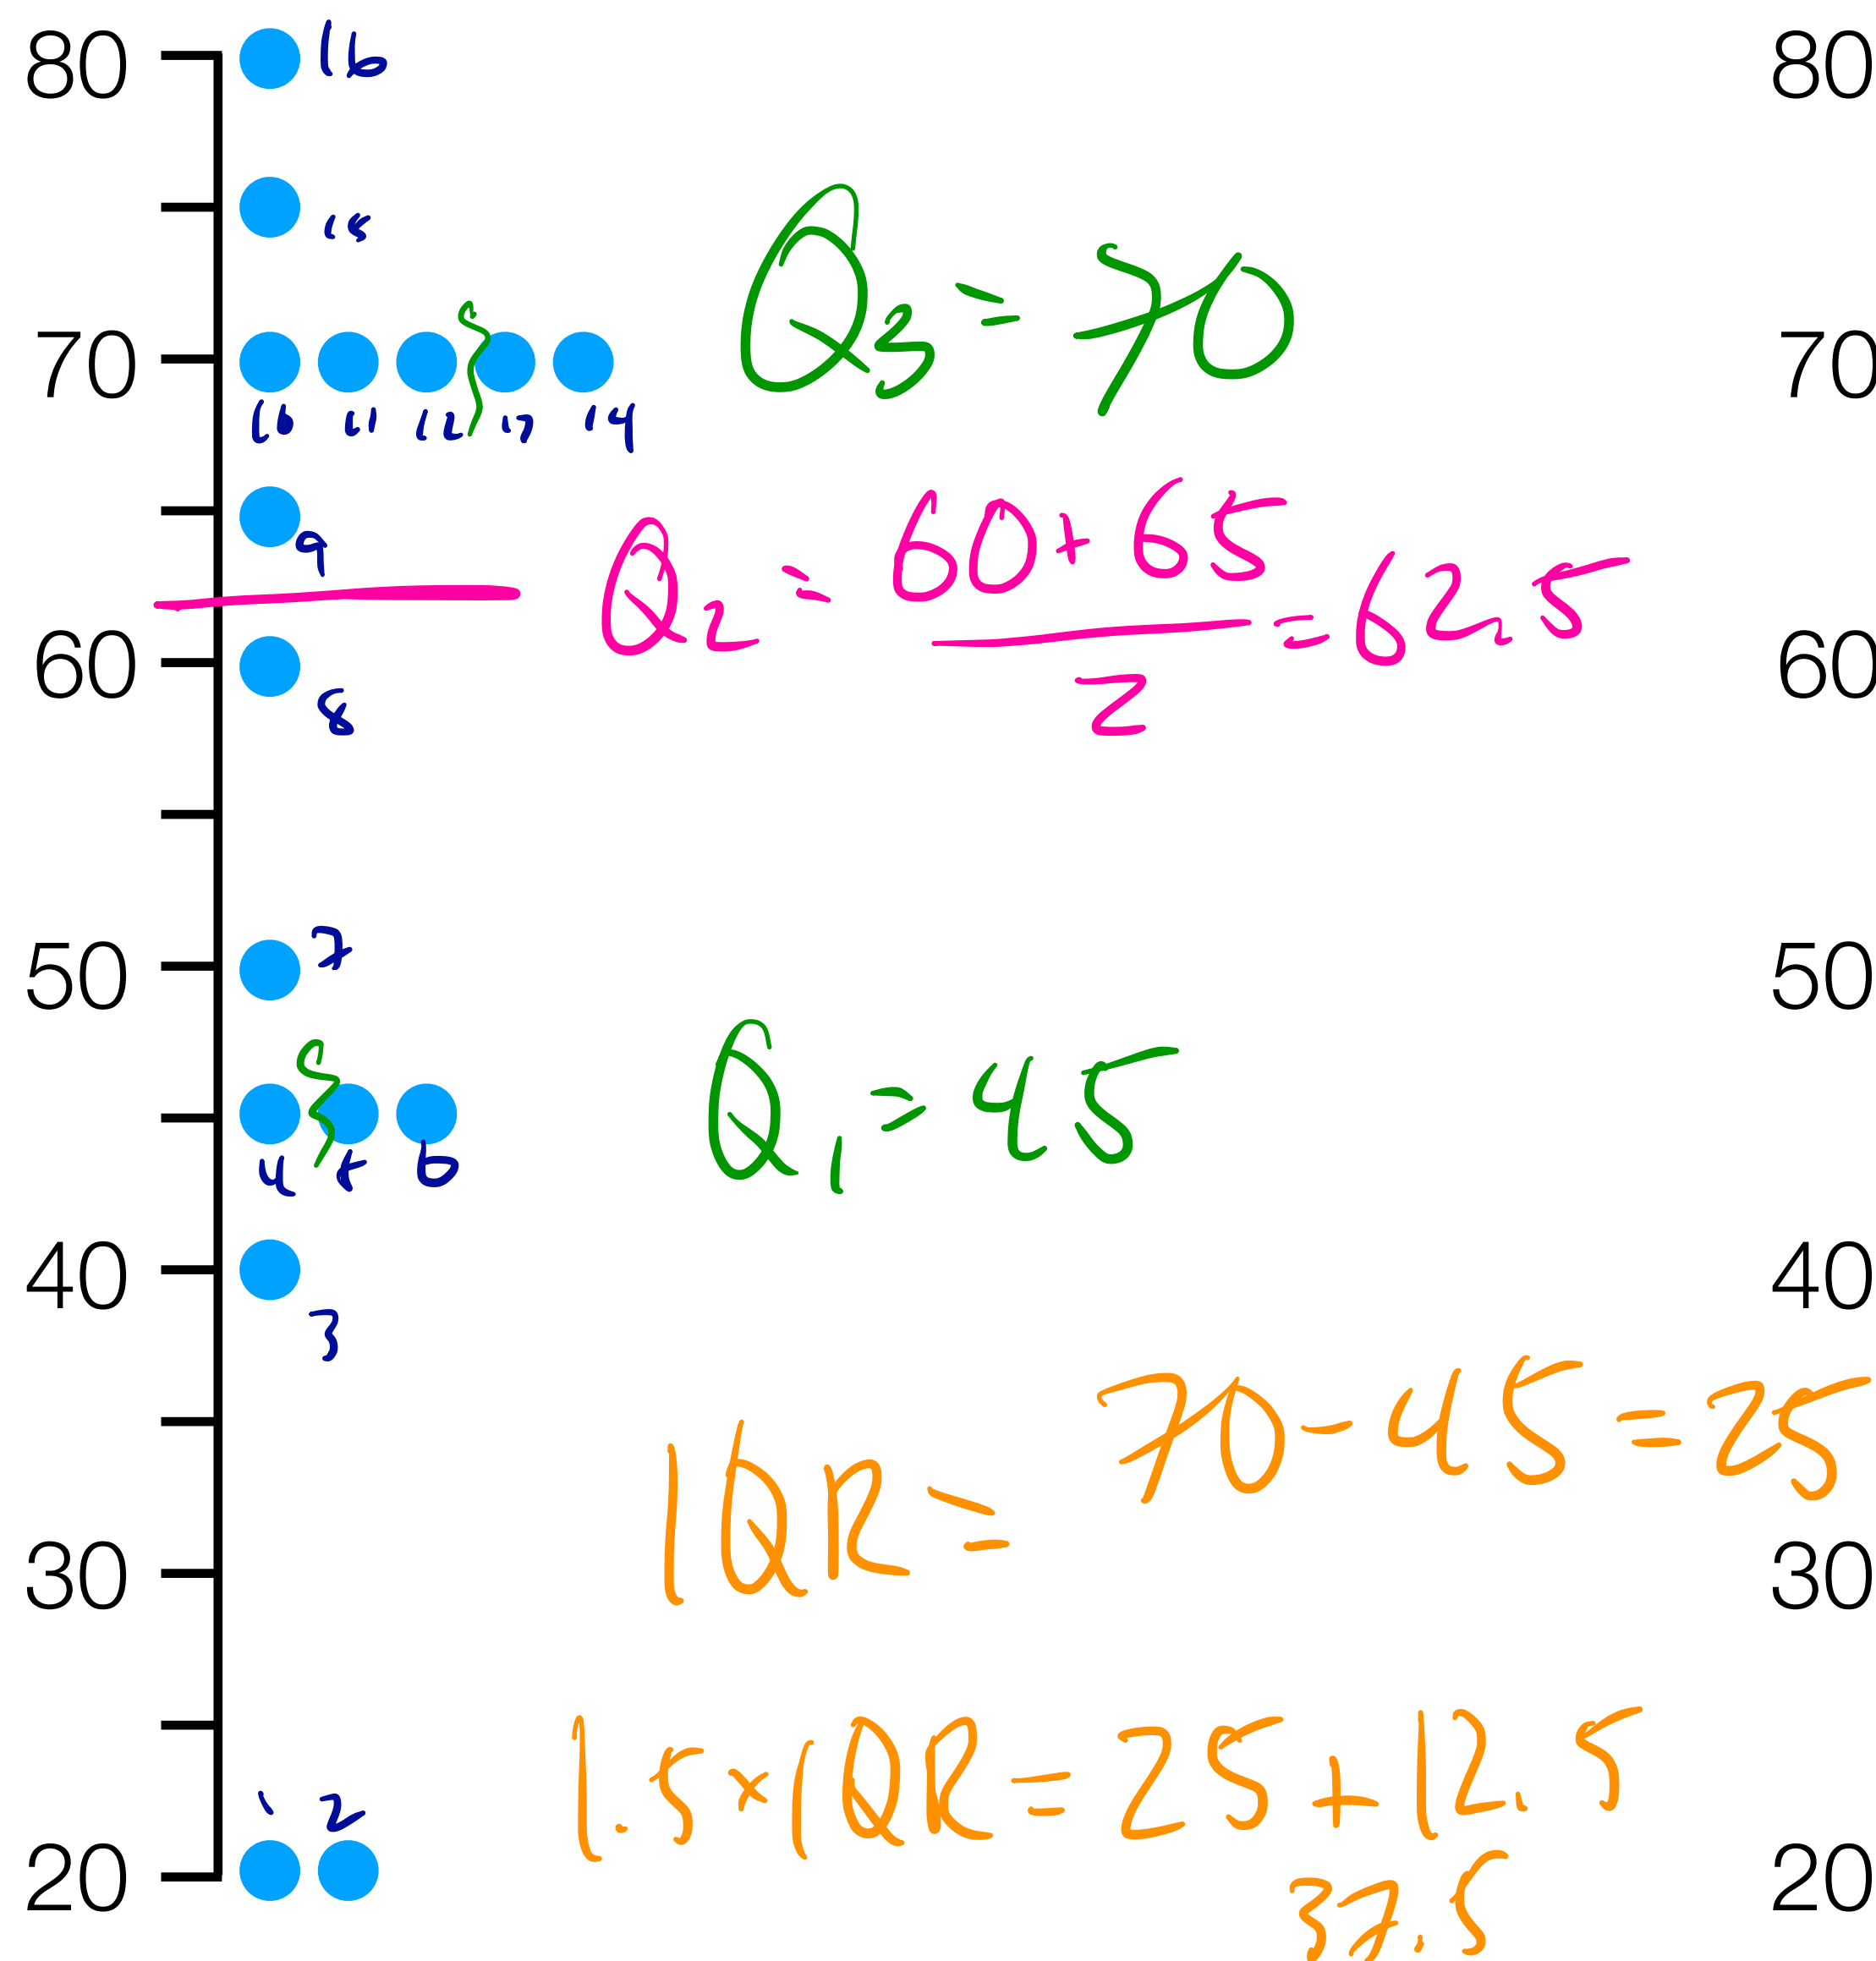

Wong, T.E. and K. Keller (2017), Probabilistic Future Flood Risk Scenarios for New Orleans, *Earth's Future*, DOI: 10.1002/2017EF000607.

Wong, T.E., A. Klufas, V. Srikrishnan, and K. Keller (2018), Neglecting Model Structural Uncertainty Underestimates Upper Tails of Flood Hazard, *Environmental Research Letters*, DOI: 10.1088/1748-9326/aac3d.

BoxPlots practice

Example: draw a box & whisker plot from this dataset

Advanced Histogram Thoughts!

it's not just about the bin *width*...

also important where the bins start!
